

ABSTRACT OF THE DISCLOSURE

5      A method and system for scheduling delivery and delivery  
of products to buyers. A Mobile Pickup Station (MPS) server  
is placed within a computer network and receives product  
shipping instructions from buyers or third party sellers. The  
MPS server determines optimal pickup points using buyer  
commuting information and buyer delivery requests. A portable  
10    kiosk or locker station, enclosing buyers' purchases within  
individually lockable lockers, is placed at a pickup point  
chosen by the buyers. The buyers use access codes, such as a  
product ID and password, to unlock the lockers and receive  
their purchases.
